

33. What aspect of the course did you like most so far and/or what could be improved in the future?

Guy who took the lecture on 27.11.19 was really nice. He involved himself with students by asking questions and relating it with programming logics.

I don't know where I will use it in the future.

I liked the Professor's involvement in students but her methodology of teaching is not sufficient enough for understanding.

I missed the first lecture and everything was out of my understanding (not in lectures, but in exercises).

I think the assignment is so difficult, I need to spend too much time to do it every week.

I want the teacher to upload the correct answer of the exercise.

I'd like to see material or slides of the lecture in Moodle, maybe it can help me understand some key points.

Just one example to define and present the schema is not sufficient, but it's my opinion.

Lectures and exercises don't sync in my opinion. Assignments are a little bit different from lecture.

Make it more practicable.

Maybe everything about this course will be clear and understandable at the end of the course because i see a lot of ambiguity things in the lecture.

The exercise course explains the exercise very clearly. I wish the handwriting in the lecture could be more recognizable.

The notions are not clear (most of them). How to use them and the lecture is poor with the examples given from the lecturer.

The teacher writes the knowledge on the blackboard, so I can understand very good. It's the best!

Videorecording would be helpful if students cannot attend, therefore change from blackboard to digital Noteblock and record.
